In the Claims:

1. (currently amended) A dispensing device for dispensing a volatile material contained in a separate refill container, to an ambient environment comprising
an electrically driven actuator device disposed in the dispensing device for dispensing the volatile material from a replaceable refill adapted to be fitted to the dispensing device,
the separate refill comprising a closure means arranged on the refill,
the closure means comprising a metallic coil,
the dispensing device comprising switch including a radio frequency transmitter and a receiver circuit capable of transmitting a signal,
the metallic coil is capable of resonating in sympathy with the signal and emitting a return resonant signal,
the dispensing device comprising a switch,
the switch and the closure means being adapted, when the refill is fitted, to enable the actuator device in a material-dispensing manner[[]],
the switch including a radio frequency transmitter and receiver circuit capable of transmitting a signal, and
the closure means comprising a metallic coil capable of resonating in sympathy with the signal and emitting a return resonant signal which is actuator device enabling.
- 2.(currently amended) A dispensing device according to claim 1, wherein the actuator device is one of a fan, blower, heating element, piezoelectric nebuliser or other electrically driven device useful in vaporizing or dispersing a volatile liquid.
3. -6 (canceled).
7. (previously presented) A process for preventing the use of inappropriate refills in an air treatment device, which includes the step of:

providing a dispensing device according to claim 1 to an ambient environment.

8. -18 (canceled)
